Auswahl-Übersicht von IE-Objekten (die u.a. den inline-Style (STYLE-Attribut bzw. objekt_zeiger.style) besitzen) zu folgenden Kategorien:

Eigenschaften (als DOM-Objekt) / Attribute (im HTML-Tag)
Styles (auch inline-Styles)
Behaviors (Standardbehaviors des Internet Explorers)
Collections (Felder als Sammlung von Daten bzw. deren Adressen (Zeiger))
Events (window.event)
Filter (Filter vom Internet Explorer)
Methoden (des DOM-Objektes)
Objekte (Unterobjekte)

Ist eine Kategorie zum Objekt nicht erwähnt, dann ist sie zum Objekt nicht implementiert.

HTML-Tag und Objekt des HTML-DOM sind formal synonym, aber oft verschieden implementiert.

Es werden auch Objekte des HTML-DOM genannt, die keinen HTML-Pendant haben.

Es wird auch ein Objekt genannt, das anhand eines Standardbehavior verwaltet wird, also an sich kein HTML-DOM-Objekt ist.

Hinweis zu Angaben der Objektbezeichner:

Jede Zeile umfasst in der Regel 2 Werte:

1. Wert HTML-Tag komplett in Grossbuchstaben
2. Wert Objektbezeichner laut HTML-DOM (nie komplett in Grossbuchstaben)

Es werden auch Objekte des HTML-DOM genannt, die keinen HTML-Pendant haben.

Hinweis zu Angaben von Eigenschaften / Attributen:

Jede Zeile umfasst in der Regel 2 Werte:

1. Wert nur in Grossbuchstaben Attribut im HTML-Tag
2. Wert nicht nur in Grossbuchstaben Eigenschaft objekt_zeiger.xxxxx

ist nur 1 Wert verfügbar:
wenn nur Grossbuchstaben dann Attribut im HTML-Tag
ansonsten Eigenschaft objekt_zeiger.xxxxx

Es werden auch Attribute genannt, die keinen HTML-Attribut-Pendant haben.

Hinweise zu Angaben von Styles:

Jede Zeile umfasst in der Regel 2 Werte:

1. Wert Angabe im STYLE-Attribut des HTML-Tag
Es gibt oft Bindestriche im Stylenamen !
Es ist auch möglich, dass der Stylenamen nur in Grossbuchstaben erscheint.
2. Wert Style in Punktnotation
Es gibt keine Bindestriche im Stylenamen, denn anstelle des Bindestriches wurde Grossbuchstabe gesetzt.
Es gibt Styles, die haben keinen Wert, z.B. haslayout.

Bsp.: background-attachment backgroundAttachment

background-attachment STYLE="background-attachment=...."
objekt_zeiger.style.backgroundAttachment=.....

ist nur 1 Wert verfügbar, so ist das Style in Punktnotation

Es werden auch Styles genannt, die keinen STYLE-Attribut-Pendant haben.

HTML-DOM (per JScript) und HTML-Code:

HTML-Objekte sind in Objekten des HTML-DOM oft umfangreicher implementiert als per HTML-Tag-Kodierung.

Dass HTML-Tags zu DOM-Objekte umgewandelt werden müssen, liegt auch an der Notwendigkeit der Zeigerbildung zum HTML-Tag, um es adressierbar, also verwaltbar zu machen - eben als HTML-DOM-Objekt.

Die Umwandlung eines HTML-Tags setzt dessen Parsen voraus. Parser sind toleranter bei HTML-Code: Unbekannte Tags werden oft

ignoriert. Der Parser des JScript ist oft gnadenlos: Unbekannte Objekte werden bemerkt.

Das pflegeleichtere Programmieren geht über HTML-Code: Was dem Browser als HTML-Tag nicht bekannt ist, kann auch kein DOM-Objekt werden.

Per HTML- DOM kann wesentlich dynamischer programmiert werden, als es HTML-Code je zulässt (dynamische Webseiten).

Folgende Objekte haben das Event onreadystatechange und somit die Eigenschaft readyState:

A, ABBR, ACRONYM, ADDRESS, APPLET, AREA, B, BASE, BASEFONT, BDO, BGSOUND, BIG, BLOCKQUOTE, BODY, BR, BUTTON, CAPTION, CENTER, CITE, CODE, COL, COLGROUP, COMMENT, CUSTOM, DD, DEL, DFN, DIR, DIV, DL, document, DT, EM, EMBED, FIELDSET, FONT, FORM, HEAD, hn, HR, HTML, I, IFRAME, IMG, INPUT type=button, INPUT type=checkbox, INPUT type=file, INPUT type=hidden, INPUT type=image, INPUT type=password, INPUT type=radio, INPUT type=reset, INPUT type=submit, INPUT type=text, INS, ISINDEX, KBD, LABEL, LEGEND, LI, LINK, LISTING, MAP, MARQUEE, MENU, namespace, nextID, NOBR, NOFRAMES, NOSCRIPT, OBJECT, OL, OPTION, P, PLAINTEXT, PRE, Q, RT, RUBY, S, SAMP, SCRIPT, SELECT, SMALL, SPAN, STRIKE, STRONG, STYLE, SUB, SUP, TABLE, TBODY, TD, TEXTAREA, TFOOT, TH, THEAD, TITLE, TR, TT, U, UL, VAR, XML, XMP

Event:

Hinweis: bubbles entspricht durchreichen der Events nach oben entlang der DOM-Hierarchie
cancels entspricht unterbrechbar

.fireEvent()

Fires a specified event on the object.

kann nur innerhalb eines Eventhandlers aktiviert werden, da ansonsten wirkungslos

Syntax

bFired = object.fireEvent(sEvent [, oEventObject])

sEvent Required. String that specifies the name of the event to fire.

oEventObject Optional. Object that specifies the event object from which to obtain event object properties.

Return Value

Boolean. Returns one of the following values:

true Event fired successfully.

false Event was cancelled.

fireEvent() setzt automatisch window.event.cancelBubble auf false, also kein Hochreichen des Events in der DOM-Hierarchie

fireEvent() liefert

true, wenn

Event erfolgreich gefeuert

oder Event nicht feuerebar aber auch nicht cancelbar

false, wenn

Event nicht erfolgreich gefeuert

UND nicht gecancelt wurde

Beispiel:

```
<HTML>
<HEAD>
<SCRIPT>
function fnFireEvents()
{
    oDiv.innerText = "The cursor has moved over me!";
    oButton.fireEvent("onclick");
}
</SCRIPT>
</HEAD>
<BODY>
<h1>Using the fireEvent method</h1>
By moving the cursor over the DIV below, the button is clicked.
<P>
<DIV ID="oDiv" onmouseover="fnFireEvents();">
Mouse over this!
</DIV>
<p>
<BUTTON ID="oButton" ONCLICK="this.innerText='I have been clicked!'" >
Button</BUTTON>
</BODY>
</HTML>
```

100. userData (Objekt als Standardbehavior) - Detailangaben

Userdaten per Datencache (UserData store) dauerhaft verwalten anstelle Cookies

für alle Objekte, die den Behavior userData unterstützen

Es können nur XML-Daten gecacht werden: HTML-DOM hat Schnittstellen zum XML-DOM.

Syntax

HTML
Scripting

```
<ELEMENT STYLE="behavior:url('#default#userData')" [ID=sID]>
object.style.behavior = "url('#default#userData')"
object.addBehavior ("#default#userData")
```

sID String als ID
optional, aber wenn kodiert, so Cacheverwaltung schneller

ab IE 5.x

Umfang des Datenbereiches:

Security Zone	Document Limit (KB)	Domain Limit (KB)
Local Machine	128	1024
Intranet	512	10240
Trusted Sites	128	1024
Internet	128	1024
Restricted	64	640

pro Objekt 1 Cache

Achtung: Cache überlebt das Schliessen einer Browserinstanz
kann durch andere Browserinstanz benutzt werden
wird ev. gelöscht wenn Cookies gelöscht werden

alle Cache werden in einem gemeinsamen Verzeichnis gespeichert mit gemeinsamen Protokoll

Cache nicht manipulierbar möglich für Objekte HTML
HEAD
TITLE
STYLE

Cache muss im selben Ordner liegen wie Webpage

Bsp.: Wenn Cache im Ordner /private/
 und Web page im Ordner /public/
 so kann Webpage nicht auf den Cache zugreifen

Beispiel:

```
<HTML>
<HEAD>
<STYLE>
.storeuserData {behavior:url('#default#userData');}
</STYLE>
<SCRIPT>
function XMLDatenAblegen(){
var CacheObjekt=CacheObjektForm.ID_Dateneingabe;
CacheObjekt.setAttribute("sPersist",CacheObjekt.value);
CacheObjekt.save("XMLDaten");
}
function XMLDatenLaden (){
var CacheObjekt=CacheObjektForm.ID_Dateneingabe;
CacheObjekt.load("XMLDaten");
CacheObjekt.value=CacheObjekt.getAttribute("sPersist");
}
</SCRIPT>
</HEAD>
<BODY>
<FORM ID="CacheObjektForm">
<INPUT CLASS="storeuserData" TYPE="text" ID="ID_Dateneingabe">
<INPUT TYPE="button" VALUE="Load" onclick=" XMLDatenLaden ()">
<INPUT TYPE="button" VALUE="Save" onclick=" XMLDatenAblegen ()">
</FORM>
</BODY>
</HTML>
```

Eigenschaften:

expires Zeitstempel der Daten im Cache lesen schreiben

Syntax Scripting `userData.expires [= sUTCString]`
`sUTCString` String Zeitstempel im UTC (Universal Time Coordinate) format.

lesen und schreiben

Original-Microsoft: "Microsoft® Internet Explorer removes the persisted information when the browser checks the date and the designated time has expired."
 also MS IE entfernt diese dauerhafte Information, wenn der Browser das Datum gecheckt und den vorgegebene Zeitpunkt als verfallen erkannt hat.

Beispiel:

```
<STYLE>
.userData { behavior: url(#default#userdata)}
</STYLE>

<SCRIPT>
function fnSave(){
    var DateObjekt = new Date();           // Start Time
    DateObjekt.setMinutes(DateObjekt.getMinutes() + 1);
    var VerfallsZeitpunkt = DateObjekt.toUTCString();

    CacheObjektDiv.expires = VerfallsZeitpunkt;
    CacheObjektDiv.setAttribute("sData",CacheObjektText.value);
    // Save the persistence data as "sTimeout".
    CacheObjektDiv.save("sTimeout");
}
</SCRIPT>

<DIV CLASS = "userData" ID=CacheObjektDiv onsave = "fnSave()" >
<INPUT TYPE=text ID=CacheObjektText>
```

Methoden:

load() Daten aus Cache lesen

Syntax `userData.load(sStoreName)`
`sStoreName` String als Chachename

liefert nichts

Beispiel:

```
<HTML>
<HEAD>
<STYLE>
.storeuserData { behavior:url(#default#userData);}
</STYLE>
<SCRIPT>
function XMLDatenAblegen(){
    var CacheObjekt=CacheObjektForm.ID_Dateneingabe;
    CacheObjekt.setAttribute("sPersist",CacheObjekt.value);
    CacheObjekt.save("XMLDaten");
}
function XMLDatenLaden (){
    var CacheObjekt=CacheObjektForm.ID_Dateneingabe;
    CacheObjekt.load("XMLDaten");
    CacheObjekt.value=CacheObjekt.getAttribute("sPersist");
}
</SCRIPT>
</HEAD>
<BODY>
<FORM ID="CacheObjektForm">
<INPUT CLASS="storeuserData" TYPE="text" ID="ID_Dateneingabe">
<INPUT TYPE="button" VALUE="Load" onclick=" XMLDatenLaden ()">
<INPUT TYPE="button" VALUE="Save" onclick=" XMLDatenAblegen ()">
</FORM>
</BODY>
</HTML>
```

save() Daten in Cache ablegen

Syntax userData.save(sStoreName)

 sStoreName String als Chachename

liefert nichts

Beispiel:

```
<HTML>
<HEAD>
<STYLE>
.storeuserData { behavior:url(#default#userData);}
</STYLE>
<SCRIPT>
function XMLDatenAblegen(){
    var CacheObjekt=CacheObjektForm.ID_Dateneingabe;
    CacheObjekt.setAttribute("sPersist",CacheObjekt.value);
    CacheObjekt.save("XMLDaten");
}
function XMLDatenLaden (){
    var CacheObjekt=CacheObjektForm.ID_Dateneingabe;
    CacheObjekt.load("XMLDaten");
    CacheObjekt.value=CacheObjekt.getAttribute("sPersist");
}
</SCRIPT>
</HEAD>
<BODY>
<FORM ID="CacheObjektForm">
<INPUT CLASS="storeuserData" TYPE="text" ID="ID_Dateneingabe">
<INPUT TYPE="button" VALUE="Load" onclick=" XMLDatenLaden ()">
<INPUT TYPE="button" VALUE="Save" onclick=" XMLDatenAblegen ()">
</FORM>
</BODY>
</HTML>
```

101. userProfile - Detailangaben

Userdaten im vcard-Puffer des Internet Explorers verwalten

Methoden:

addReadRequest()	doReadRequest()	setAttribute()
clearRequest()	getAttribute()	

Beispiel:

```
// Zugriff-ArtenPuffer leeren für ev. späteren Zugriff auf Userdaten
navigator.userProfile.clearRequest();

// Zugriff-Arten puffern
navigator.userProfile.addReadRequest("vcard.displayname");
navigator.userProfile.addReadRequest("vcard.gender");

// Zugriff-Arten parallel ausführen und Daten lesen und puffern
navigator.userProfile.doReadRequest(0, "Acme Corporation");

// Datenpuffer auslesen
var name = navigator.userProfile.getAttribute("vcard.displayname");
var gender = navigator.userProfile.getAttribute("vcard.gender");

// Die Userdaten sind verfügbar und können verwertet werden
//      dann zurück per setAttribute()

// Zugriff-ArtenPuffer leeren für ev. späteren Zugriff auf Userdaten
navigator.userProfile.clearRequest();
```

addReadRequest Method()

Zugriffart puffern

bSuccess = userProfile.addReadRequest(sAttributeName [, vReserved])

sAttributeName	Name des vCard-Elementes	
vReserved	zur Zeit ohne Funktion	
bSuccess	true	Pufferung erfolgreich
	false	Pufferung nicht möglich wegen Parameterfehler oder Zugriffart ist bereits gepuffert

clearRequest Method()

Puffer der Zugriffarten leeren

userProfile.clearRequest();

liefert nichts

doReadRequest()

gepufferte Zugriffsarten ausführen

userProfile.doReadRequest(vUsageCode [, vFriendlyName] [, vDomain] [, vPath] [, vExpiration] [, vReserved])

vUsageCode	Nutzungscode, frei wählbare Code von 0 bis 12 Vorschlag für Code-Zuordnung 0 Nutzungscode des System-Administrator 1 Nutzungscode für Produktentwicklung 2 Nutzungscode für Support 3 Nutzungscode für Customizing
vFriendlyName	... optional, String frei wählbarer String mit Bedeutung laut vUsageCode
vDomain	optional, String freie Zusatz-Webadresse
vPath	optional, String Pfad des Domainserver, der den Zugriff auf vCard ausführt
vExpiration	optional z.Z. ohne Funktion
vReserved	optional z.Z. ohne Funktion

liefert nichts

User kann Zugriff auf vCard-Puffer erlauben oder sperren.

getAttribute Method()

Date des letzten Zugriffes holen

```
sValue = userProfile.getAttribute(sAttributeName)
```

sAttributeName String
Bezeichner des vCard-Elementes in Punktnotation
Warnung: Gross-Klein wird unterscheiden, so dass abweichende
Schreibweise ein anderes Element liest

0 wenn Attribut mit Namen in Schreibweise laut sAttributeName
vorhanden aber egal ob Gross- oder Kleinbuchstabe,
so Element füllen
(falls mehrere gleich vorhanden bei unterschiedlicher
Schreibweise, so immer das zuerst erzeugt Attribut benutzen)
nicht vorhanden dann neues Element erzeugen und füllen
1 wenn Attribut mit Namen in exakter Schreibweise laut sAttributeName
vorhanden, dann Inhalt überschreiben
nicht vorhanden dann neues Element erzeugen und füllen
